

Product Updates Brochure

What is new across the YSS AI Online Course and AI Assist modules

Prepared for existing Version 2 clients who have been using the course platform and want a clear view of the latest substantive upgrades.

RELEASE FOCUS Version 2 to v2.1.0	REVIEW WINDOW Last two months	AUDIENCE Existing clients
---	---	-------------------------------------

At a glance

The platform has moved from a course site with AI Assist access into a fuller client enablement environment: secure licensed access, stronger admin controls, richer module coverage, more applied accelerators, improved document handling, support, and voice dictation in supported browsers.

SECURE Course access Licensed users launch AI Assists through short-lived secure links from the course site.	COVERAGE Expanded AI suite Modules 1-6 now have dedicated AI Assist experiences, including the newest Module 6 accelerators.	PRODUCTIVITY Client workflow Users can attach source documents, export sessions, copy responses, and dictate prompts.
OPERATIONS Admin control Organizations, domains, seats, users, sessions, and activity are visible in one branded admin area.	HELP Support A dedicated AI Support Assistant helps users with access, modules, attachments, exports, and troubleshooting.	QUALITY Safety and fit Module scope checks, moderation, access validation, and cleaner prompts keep outputs focused.

What clients will notice

The most visible change is that the course feels more joined-up. Video lessons, worksheets, AI Assists, support, and launch flows now work together as one learning and implementation environment.

- A cleaner course library and module detail experience for Modules 1-6, with embedded lesson videos, helper videos, downloadable worksheets, and direct AI Assist launch links.
- A central AI Accelerators hub that groups the AI Assists so users can quickly return to the tool they need without hunting through modules.
- Secure AI Assist launches from the course website into the modules app, using signed short-lived tokens rather than open standalone links.
- A new Support button, when enabled, that opens a dedicated AI Support Assistant for course access, module usage, attachments, exports, and common troubleshooting.
- Local progress indicators and completion toggles so users can keep track of their course journey in the browser.

What client administrators will notice

ADMIN Licensing and user management Admins can create organizations, set approved email domains, define seat counts, invite users, assign roles, and manage deactivation, reactivation, password links, forced resets, and deletion.	REPORTING Visibility and control The admin area now summarizes organizations, seats in use, pending activations, active sessions, and user activity. Activity can be filtered by organization, date, event type, and search terms.
---	---

- Bulk activation link generation helps administrators recover or complete pending user setups without manual one-by-one handling.
- Session tracking limits active sessions, records device context, and can revoke older sessions when limits are exceeded.
- Usage events capture meaningful actions such as logins, module opens, video plays, AI Assist launches, resource downloads, lesson completion toggles, and password reset completions.

What is new in the AI Assist modules

The modules app has been consolidated into a shared multi-module architecture. Each AI Assist has its own module-specific instructions and UI copy, while the shared chat interface, streaming backend, access control, attachments, moderation, exports, and dictation are maintained in one place.

Area	Recent enhancement	Client value
Modules 1-2	Quiz-style AI Assist experiences tied to the early foundation modules.	Reinforces understanding before users move into deeper story-building work.
Module 3	Richer current-story evaluation and stronger diagnostic logic.	Helps users see whether their existing sales weapons are customer-focused or self/company/product-focused.
Modules 4-5	Improved critique and refinement prompts for customer issues, outcomes, and differentiators.	Gives more actionable coaching on the core Your Sales Story components.
Module 6	Additional applied-output accelerators for calls, emails, voicemails, conversational stories, social voice notes, and profile About sections.	Turns the finished sales story into usable prospecting and positioning assets.
All modules	Voice dictation, copy response, export session, file attachments, and tighter scope validation.	Makes the tools easier to use and keeps outputs aligned to the module purpose.

Module 6 applied accelerators

- Three live prospecting phone call outline variations.
- Three target-prospect email outlines, including a short contextual prospecting email.
- Two voicemail outline variations.
- A conversational sales story response for the question, “What does your company do?”
- A short social voice-note script for social or direct-message outreach.
- A professional social profile About section for either a person or company profile.

Better inputs, better outputs

WORKFLOW Document-aware assists Users can attach text, PDF, and Word documents. The modules app extracts readable content and makes it available to the AI Assist as source material for that session.	WORKFLOW Session export Users can export a full AI Assist session as a document, making it easier to save drafts, coaching, and final outputs.
WORKFLOW Focused responses Moderation and module scope checks reduce off-topic usage and keep each AI Assist aligned to the course activity it is meant to support.	WORKFLOW Browser dictation Supported browsers now let users speak into the module composer, review the transcribed text, and send it as a normal prompt.

A stronger platform foundation

- The course website now acts as the secure front door for learning, licensing, user management, support, and AI Assist launches.
- The modules app now acts as the specialized AI workbench, with a shared UI and backend that can keep expanding without cloning separate apps.
- Existing licensed clients can be granted access to new sibling accelerators without blocking users while licensing data catches up.
- The support assistant is intentionally separated from the production modules, so users can ask how to use the platform without accidentally generating module deliverables in the support channel.

Suggested client-facing summary

The newest YSS AI course release gives licensed users a smoother course experience, a broader set of AI Assist tools, richer applied outputs, secure module launching, stronger admin visibility, and more flexible input methods including document attachments and voice dictation in supported browsers.

Recommended rollout note

Clients who have already used Version 2 should be told that the latest release is not just a cosmetic refresh. It expands what the platform can help users produce, strengthens the way access is managed, and makes the course easier to support at scale.

- For learners: emphasize easier access to AI Assists, more Module 6 output options, document attachments, exports, and dictation.
- For sales leaders: emphasize better adoption support, clearer workflows, and more practical ways to turn the sales story into outreach assets.
- For administrators: emphasize licensing, seat management, activation recovery, session controls, and usage visibility.

YSS AI Online Course v2.1.0: a broader, safer, more usable AI-enabled course platform.
