

What clients will notice

The most visible change is that the course feels more joined-up. Video lessons, worksheets, AI Assists, support, and launch flows now work together as one learning and implementation environment.

- A cleaner course library and module detail experience for Modules 1-6, with embedded lesson videos, helper videos, downloadable worksheets, and direct AI Assist launch links.
- A central AI Accelerators hub that groups the AI Assists so users can quickly return to the tool they need without hunting through modules.
- Secure AI Assist launches from the course website into the modules app, using signed short-lived tokens rather than open standalone links.
- A new Support button, when enabled, that opens a dedicated AI Support Assistant for course access, module usage, attachments, exports, and common troubleshooting.
- Local progress indicators and completion toggles so users can keep track of their course journey in the browser.

What client administrators will notice

ADMIN Licensing and user management Admins can create organizations, set approved email domains, define seat counts, invite users, assign roles, and manage deactivation, reactivation, password links, forced resets, and deletion.	REPORTING Visibility and control The admin area now summarizes organizations, seats in use, pending activations, active sessions, and user activity. Activity can be filtered by organization, date, event type, and search terms.
---	---

- Bulk activation link generation helps administrators recover or complete pending user setups without manual one-by-one handling.
- Session tracking limits active sessions, records device context, and can revoke older sessions when limits are exceeded.
- Usage events capture meaningful actions such as logins, module opens, video plays, AI Assist launches, resource downloads, lesson completion toggles, and password reset completions.
