

Better inputs, better outputs

WORKFLOW Document-aware assists Users can attach text, PDF, and Word documents. The modules app extracts readable content and makes it available to the AI Assist as source material for that session.	WORKFLOW Session export Users can export a full AI Assist session as a document, making it easier to save drafts, coaching, and final outputs.
WORKFLOW Focused responses Moderation and module scope checks reduce off-topic usage and keep each AI Assist aligned to the course activity it is meant to support.	WORKFLOW Browser dictation Supported browsers now let users speak into the module composer, review the transcribed text, and send it as a normal prompt.

A stronger platform foundation

- The course website now acts as the secure front door for learning, licensing, user management, support, and AI Assist launches.
- The modules app now acts as the specialized AI workbench, with a shared UI and backend that can keep expanding without cloning separate apps.
- Existing licensed clients can be granted access to new sibling accelerators without blocking users while licensing data catches up.
- The support assistant is intentionally separated from the production modules, so users can ask how to use the platform without accidentally generating module deliverables in the support channel.
